Reasons for Allowance

Kara fails to disclose the embodiment of claims 1 and 24 that calls for a separate sender public key and a receiver public key. While seemingly trivial, this limitation in reality doubles the number of public keys used, complicating the invention recited by claims 1 and 24 substantially and changing the roles offered by each cryptographic element. No art can be found which reads upon this further limitation.

Kara also fails to explicitly disclose that the recipient public key is stored in a public key database. However Kara discloses in Figure 3a, section 3003 that the public key is requested from a certification system. To acquire a public key from a database in a certification authority was well known, and indeed is the expected memory structure from which a public key would be expected to be obtained.

Kara also fails to disclose the directory interface structure to the public key database. Yet, because virtually all computers use a directory interface structure, such a limitation to access the public key database would be well known to those in the art.

No art which reads upon the rest of the structure of Applicant's independent claims 1 and 24 can be found as currently amended. No reasons or motivation can be found to combine a second key pair used by both the sender and receiver can be found. For this reason, claims 1 and 24 are allowable.
